SPREADER BEAM

When the spreader beam is used in conjunction with one of our booms or an existing lifting boom, the ability to securely lift long, bulky loads becomes much easier and safer. The operator would use slings, cables, chains or other lifting straps to wrap around the product being lifted and then securely attach to the spreader beam. The spreader beam acts as a stabilizer between the two ends of the product being lifted and decreases the chance that the product has to swing or shift during lifting and moving. Lengths up to 20 feet and capacities up to 50,000 pounds are available. Call today to discuss your application.
